

Contents

1. Introduction	11
2. Mathematical principles of electrostatic methods	17
2.1. Basic solution for planar systems	18
2.2. Electrostatics of periodic system of strips	22
2.2.1. Principles of the BIS-expansion method	28
2.3. Electrostatics of finite system of strips	33
2.4. Electrostatics of strips - generalization for strips in 'incident' (external) electric field	39
2.4.1. Periodic system	39
2.4.2. Finite system	41
3. Application in acoustic beamforming analysis	47
3.1. Boundary-value problem formulation	48
3.1.1. Surface harmonic impedance of an acoustic half-space	48
3.1.2. Boundary conditions on the baffle plane	49
3.2. Periodic baffle system	51
3.2.1. Wave generation by periodic baffle system	54
3.2.2. Plane wave scattering	60
3.3. Finite baffle system	66
3.3.1. Beam-forming by finite baffle system	73
4. Application in ultrasound imaging	81
4.1. Multi-element synthetic aperture method	83
4.2. Modified multi-element synthetic aperture method	85
4.3. Numerical examples	88
5. Modeling of 2D periodic structures	97
5.1. Generalization of BIS-expansion method	101
5.2. Induced electrostrictive stress in the dielectric layer	105

6. Other applications	109
6.1. Electromagnetic wave scattering by non-planar periodic structures . . .	110
6.1.1. Plane wave scattering by a thick-walled parallel-plate waveguide array	110
6.1.2. Plane wave scattering by a periodic system of thick electrodes. . .	124
6.2. Electrostatics of strips with broken periodicity	132
7. Conclusion	137
