**On Symmetric Tensors
of Second and Fourth Order
in Mechanics**

with focus on Cauchy stress and Hooke tensors

WARSAW 2025

Contents

Lecture 1. Elements of philosophy and practice of Science	11
1.1. Elements of philosophy and practice of Science	11
1.2. Aims and targets of the present study	14
Lecture 2. Perception and description of physical phenomena	15
2.1. Tensorial calculus, native language of natural sciences. Geometric-algebraic dualism of tensors	15
2.2. Cauchy's concept of pressures non-perpendicular to the surfaces	16
2.3. Cauchy's stress as macroscopic constitutive model describing force interactions in materials	17
2.4. Perception of physical phenomena. Limitations or capabilities of human senses?	19
2.5. What tensors are, how they can be understood, some historical information	20
Lecture 3. Algebraic, operational and geometric definitions of tensors	23
3.1. Algebraic definition of tensors	23
3.2. Algebraic structures of tensorial calculus	24
3.3. Translation rules between absolute notation and indicial nota- tion of tensors	32
3.4. Operational definition of tensors	33
3.5. Geometrical definition of tensors	34
Lecture 4. Symmetries of tensors and convenient notations of symmetric tensors	35
4.1. A concept of symmetry	35
4.2. Internal symmetry of tensors	35
4.3. External symmetry of tensors. Second order orthogonal tensors	37
4.4. Second order and fourth order symmetric tensors convenient notations	38
4.4.1. Cauchy tensor in standard, Kelvin and principal values notation	38

4.4.2. Hooke's tensor in standard, Kelvin and Voigt notation .	39
4.5. Unit tensors of various orders	42
Lecture 5. Invariants and decompositions of second order symmetric tensors	45
5.1. Coordinate system versus Reference frame	45
5.2. Various bases of second order symmetric tensors	46
5.3. Invariants (Eigenproperties) of second order symmetric tensors	47
5.4. Various decompositions of second order symmetric tensors . .	49
Lecture 6. Haigh–Westergaard space	55
6.1. Haigh–Westergaard space of stress tensor principal values . .	55
6.2. Critical surfaces for isotropic materials in Haigh–Westergaard space	56
6.3. Non-isomorphic and isomorphic coordinates in Haigh–Westergaard space	59
6.4. Vectorial decomposition of octahedral traction vector	61
Lecture 7. Pure shears as convenient comparison reference states	63
7.1. Lode angle expressed in terms of principal values and principal invariants	63
7.2. Lode angle lack of lucid physical interpretation	63
7.3. Some properties of pure shears and their physical interpretations	64
Lecture 8. The concept of isotropy angle θ_{iso}, the concept of shear stress mode (skewness) angle θ_{sk} and its statistical-physical interpretation	69
8.1. New structural parametrization of Cauchy stress tensor with isotropy angle θ_{iso} and shear mode angle θ_{sk}	69
8.2. Rychlewski's index of tensor anisotropy based on normalized maximum diameter of a tensor	71
8.3. Statistical interpretation of stress tensor deviator invariants, shear stress mode angle θ_{sk} as a measure of entropic part of anisotropy of Cauchy stress tensor	74
Lecture 9. Spectral decomposition of Hooke's tensor and some of its consequences	79
9.1. Structure and some properties of Hooke's tensor of anisotropic materials resulting from its spectral decomposition	79

9.2. Decomposition of Hooke's law into six uncoupled linear relations	80
9.3. Decomposition of elastic energy of anisotropic materials into (maximum) six independent parts	83
9.4. Strength criteria of anisotropic materials based on elastic energy	83
9.5. Spectral decomposition of Hooke's tensor of isotropic materials	84
9.6. The concept of isometric tensorial bases	86
Lecture 10. Interaction of Cauchy stress and Hooke's tensor – the case of elastic isotropy	89
10.1. Decomposition of elastic energy of isotropic materials into two uncoupled parts, volumetric and distortional	89
10.2. Some remarks on strength of materials criteria based on stored elastic energy for linear elastic isotropic materials	90
10.3. Simple shear and planar shear as experimental layouts realizing pure shear states of stress and/or strain	91
Lecture 11. Biaxial (planar) tests in experimental examination of material behavior	95
11.1. Specific features of biaxial tests	95
11.2. Relations between triaxiality factor and shear stress mode angle θ_{sk} (θ_L) in biaxial tests	98
Lecture 12. Closing remarks and summary	103
12.1. Other than stress physical interpretations of the second order symmetric tensors	103
12.1.1. Novozhilov's material tensors	103
12.1.2. Christoffel's acoustic tensor	104
12.1.3. Hooke's tensor of 2D materials	106
12.2. Some open scientific problems of mechanics	106
12.3. Summary	107
12.4. Supplementary materials	111
12.4.1. On Wisdom	111
12.4.2. On linear elasticity (Hooke's) constitutive law	112
12.4.3. On types of ordering of orientational dipoles	113
Bibliography	115
